

Alphabet alphabet

This is the ancestor of all modern day alphabets except for those recently invented. That it is built on the Ogham alphabet comes as somewhat (!) of a surprise. The earliest known date for the Ogham is about 500 AD and the date for the Alephbet around 1500 BC.

Yet the derivation is necessarily true. The transpositions are regular and the numerical sequences are in order and the phonetic doubling is phonetic. And mathematically it's a trapdoor. That is, you can complexify Ogham to Alephbet but you can't simplify Alephbet to Ogham. The chance of the phonetic doublings lining up by chance is just too unlikely.

Furthermore the Alephbet is built on Hebrew phonetics. Not Syriac, Ugaritic, Punic, Arabic or Greek. They all have to add or delete letters for their own phonetics. See the Book on Origins for the original letter forms and how they were derived from the Egyptian Hieratic writing.
